

## Thinking

So, in the beginning, long before life appeared, the Universe could not think (It was not conscious). It was just rocks and gas floating and spinning around. Crashing into each other.

But by arranging it's 118 building blocks (ATOMS) in a special way, it created life. Now the Universe could think! It had consciousness! It could feel. It could see! It could also make clocks, and tell the time! It could count the days it takes for the Moon to go around The Earth.

Recently "life" has made incredible telescopes which can look back in time to when the Universe was first created (Google the James Webb telescope). Read more here; <https://www.astronomy.com/science/ask-astro-how-far-back-in-time-can-the-james-webb-space-telescope-see/>

A few questions to think about; maybe you have some possible answers?

Why has the universe created consciousness? Does it want to study itself?

Have humans been created for a special purpose, maybe to be the Guardians of the Galaxy?

Will humans, animals and plants keep evolving forever?

Maybe you have other ideas regarding what purpose life has?

Lots of questions which we hopefully will one day find the answer to.
